Team Feedback Analysis

Date	Apr 6 th , 2026
Tutorial Section	TUT0116
Communication Instructor	Ebru Bag
Prepared By (Your name and student #)	Henry (Yeonjun) Kim

<u>600</u> words

State your word count (excludes Cover Page, Evidence Excerpts, and Appendices)

- ☒ Y Have you included the “Peer Feedback” section of your Peer Evaluation #1 report, and have you highlighted in it the segment of feedback you are using as evidence? [Y or N]
- ☒ Y Have you verified that you have included at least two additional new pieces of evidence to support your claims? [Y or N]
- ☒ Y Have you pseudonymized all team member names in evidence and in your writing? [Y or N]
- ☒ N Have you used Generative AI (or Large Language Model) in the writing of this report? [Y or N]
If yes, you must follow the GenAI usage and documentation course policy.

If any required components or sections are missing (including cover page or appendix), or the document does not follow the Documentation and Formatting Requirements, your assignment is considered incomplete, and standard course late penalties will accrue until the submission is complete.

1.0 Introduction

In Peer Evaluation #1, I received feedback that I should participate more actively in team discussions, provide stronger idea inputs, and be more engaged during in-person meetings (Appendix A). To address this feedback, I contributed more actively during the CDS process by proposing ideas and using my technical knowledge to explain our design more clearly. This feedback was chosen because it was directly related to my role in idea generation and technical design. This report discusses the actions I took during an in-person design meeting prior to the CDS submission to address this feedback through preparation, presentation, and technical testing.

2.0 Description of the Situation

During the Idea Selection process, our team needed to decide which concept was most feasible to develop further. At our 8th in-person meeting, I used a whiteboard to present three alternate design directions: a hard-hat concept, a gyroscope-based wand concept, and a general buzzer system. I explained the detection method, physical layout, and intended use of each option. This allowed the team to visually compare each option in detail.

Figure 1. Whiteboard presentation of three alternate concepts

To support this discussion, I began developing a more concrete version of the gyroscope-based wand concept, which was selected after multiple deliberations among the options. I created a prototype model using *Blender* software. Figure 2 shows the result of this modeling work.

Figure 2. *Blender* model is used to visualize the concept.

I also visited MyFab to inspect parts and sensors for the prototype and tested the gyroscope-based system to determine whether it could function in practice. Figure 3 shows the component selection and subsequent feasibility testing. Once the test worked, I shared the result with the team (Appendix B). This gave the team both a conceptual explanation and an early technical basis to build an actual prototype for presentation.

Figure 3. Component selection at MyFab (left) and subsequent feasibility testing (right).

3.0 Analysis of Feedback Implementation

To respond to the feedback, I made my contributions more visible during team discussions and more helpful to the team's Idea Selection. As shown in Figure 1, I prepared and presented three alternative concepts during the meeting so that the team could compare them in a more structured way. By organizing the concepts on the whiteboard, I helped the team understand each concept clearly and compare detection methods, physical layouts, and intended uses in a more focused way.

I further strengthened my contribution by creating the model in Figure 2 using *Blender*. By turning our idea into a more realistic visual form, I was able to communicate the concept more clearly to both the client and my teammates. This also showed that my response continued after the meeting, as I worked more consistently and with greater initiative. In addition, as shown in Figure 3, I visited MyFab and tested the system to determine whether the concept could function in practice. This provided early technical evidence, reduced uncertainty in the team's decision-making, and helped the group move toward a more informed and realistic design direction. Because the discussion was supported by visual, technical, and practical evidence, I believe that my response to the feedback had a positive overall impact on the team.

4.0 Conclusion

By preparing three concepts for presentation, creating a *Blender* model, and testing the gyroscope-based system, I was able to respond to the feedback that I should participate more actively in team discussions and provide stronger idea inputs. In the future, I will continue using this approach so that I can participate more actively in team discussions, provide stronger idea inputs, and be more engaged during in-person meetings.

Appendix

Appendix A. Peer Feedback Excerpt

Appendix A.1: Selected feedback as evidence is highlighted in yellow.

Peer Feedback

It will be helpful if you are more involved in our team discussions and provide quality idea inputs for the group. I understand that maybe English is not your most fluent language, but we would still love more ideas from you on top of the great initiative and energy that you provide. For example, it will be great if you are more concerned with group work instead of being distracted by other courses during our weekly team meetings, as well as during the weekly tutorials.

I like how you performed your team role as quality assurance manager when you pointed out how the service environment section was missing information on living things. I responded saying how we could loop in the group, but it never was, and we got penalized on the rubric as a result. Proofreading our assignments like this makes sure our final mark is high by meeting all expectations. Pointing out this missing information on our PR would have helped us if I had changed the section. In hindsight, I should have changed it. In the future, I hope you continue to review our team's work as exhaustively. I would also like to comment on your good ideas. Your two ideas of a torch buzzer with a gyroscope detection system and hardhats with buzzers on top of them seemed to wow the client. He later mentioned how he wanted our proposed solutions to be out of the box, which both of those ideas are. By coming up with these two choices, you gave our team good options to choose from when deciding on our three proposed designs and pleased the client in doing so. In the future, I hope you continue to engage in team discussions and come up with fresh ideas so we have the best base to launch our CDS off of.

This team member helped the team stay on track with completing tasks by taking responsibility for their assigned work and communicating their progress to the group. They contributed to the overall workflow by updating the team when parts of their work were completed and making sure other knew what had been done. This helped the team coordinate different parts of the project effectively and ensured that everyone understood how the work was progressing. Their reliability made it easier for the group to stay organized and maintain steady progress toward our deadlines.

*I can tell you're very intelligent and that you care about doing well, but I've noticed that during our brainstorming sessions at team meetings or in tutorial when we have some important discussions, **you're often working on something else instead of being present with the group.** It means you end up missing important context and decisions that were made as a team, which puts us at a tough spot later on. I understand that you have other work, but those group discussions are really where the important stuff gets figured out. In the future it would be great if you set aside the other stuff for just an hour and focus on this.*

During the PR, you pulled your weight and contributed to the team's progress. An area of growth would be staying more on track with internal deadlines.

Appendix B. Shared Gyroscope Test Result

Appendix B.1: Team message showing the shared gyroscope feasibility test result confirming that the sensor was working.
